CLEANING & CARE

CONCRETE

CARE & MAINTENANCE

Concrete is a hardwearing and resistant stone, however it can be prone to stains and chips if not cared for correctly. We recommend that the concrete products should be cleaned immediately after use, rinsed with warm water or a pH neutral cleaner, and dried with a soft cloth.

Please follow the instructions on the packaging of your chosen cleaner, and do not use cleaning products that contain bleach or harsh chemicals.

As an additional protective barrier, use wax to nourish the concrete product and maintain a clean, polished surface.

DO NOT

Leave any liquids on the surface, especially liquids containing acids or alkali as these may cause corrosion to the concrete surface.

Leave items on the concrete surface that will allow a vacuum to form or cause a difference in texture.

Clean the concrete product with abrasive materials such as metal pads, as this may result in scratching and permanent damage.

Place heavy objects directly onto the concrete surface, as this risks chipping and breakages.
